Hydrogen – Metal

Everybody knows that the common hydrogen is a flammable gas of density very light. However, if we compress very strongly the hydrogen, the theory predicts that it is transformed into metal, and it would be possible that this metal phase is stable in common temperature. .

It is also the unique inexhaustible source of Energy for all the manners, appropriate , non-polluting, being able to be produced in unlimited quantity, in a cost of 1.000 USD the ton, once experience the modules of production the special patent of which we also have, put deposited except community Europe in 1997. The synthesis of the metal hydrogen was not realized this day by the others laboratory Nevertheless the Civil society or Non-trading company of management of intellectual and individual protection (SCM) produced in 1987 already five patches of 5 grams of this new stable metal High temperature and low-temperature (HTBT) and High-pressure and low-pressure (HPBP), in 1998 two bars of 1.000 grams, and in 2.001 of the Deuterium - Metal for a 50 gram bar.

Cold Fusion

The cold fusion is a nuclear fusion realized in pervading conditions of temperature and pressure.

My own process is parallel to that of the team of the University of Los Angeles, but shaped in 1996 within my personal and private Laboratory:

A small cylinder in which we replace the air by some deuterium to the gas state in -33 ° (the deuterium is some hydrogen with a neutron, which we find in quantity in the sea water). We introduce a crystal there, extremely rare - the property of which is to emit continuously one thousand times dose of successful energy and it during several years without outside pyro, natural excitement - electric - that is it creates an electric field in the slightest change in temperature.

We carry then the whole in +7 °, what generates in some seconds a 200 000 volt electric field, an intense enough field to separate the pits of the deuterium of their electrons and to admit them to collide with those of the crystal. There is a fusion of protons between them -(positive particles of the core)- and a emission of neutrons, which do not merge. It is this emission which serves for measuring the quantity of energy produced by the fusion.

We so managed to produce some energy in unlimited quantity, allowing us to feed our installation with electric current in total autarky, and to reduce so our costs of functioning to divers domains.

This crystal is exceptional in its applications and to give it the name would return has to break our current headway: the thorough problem, in this current period of takeover by the financial bodies of the possible patents, brought to us to the biggest caution as regards our results

And, as we look for no outside financing, we do not need to submit ourselves to the requirements lauded by the scientific Community, only our results are strictly estimated ...

For example we can make estimate our bars or patches of Hydrogen - Metal: a simple spectroscopy in YEW will give as result, only, the element H.

Indeed one of three geneses focusing for the obtaining of the Hydrogen - pure Metal with one thousand thousandth, and stable HTBT, uses this process of cold fusion above described.

There is another process of Cold Fusion which also gives, and in a more continuous way, the possibility to obtain from some Hydrogen - stable Metal and in bigger quantity by module of production:

When a metal as the XXXXXXXXXX is used in fusions with cold, it goes out of it covered with eruptions looking like micro computing volcanoes. This puts in evidence the waste of a very big quantity of heat pulling the cast iron and the evaporation of the metal, but only in tiny points.

Knowing the melting point of this rare metal , we calculated the quantity of energy necessary for the fusion of these nano - points without provoking of fusion surrounding. Seen the unhoped-for figure which we found, the source of energy can be only nuclear.

My spectrometer allows an exact measure of atoms and determined a emission of helium (10 for 10.000). This got back heat allows the usage of an unlimited energy.

What counts above all, is the conservation of Process and the acquisition of the results, their possible putting at disposition on the world plan, under certain conditions, which are not necessarily expensive.

The First Prototype

Besides we put in production since June 2007 in Turkey, a measuring platform 10x5 metres which produces in cold fusion 600 mégawats per hour, and 300 cubic meters of pure water a day as waste. The stake under procedure of fusion required only a 35 watt power during the first four hours.

The prototype consists of four packagings of liquid nitrogen endowed with several couples anodes of quadripolar catodes in rare and special metals among which one has the specific property to accelerate any émissionde one thousand of time the successful dose.

Become of my Special Patents

My Special Patent of Hydrogen-metal is being developed for the benefit of mankind given the global energy crisis. I shall explain how we can produce some hydrogen metal in the form of ingot or of stable patches with ambient temperature, and which are the uses possible, in aerospace, by running for car, and in unlimited source of energy, and of the constitution of the monopoly which we want to establish, to the advantage of the users, private and industrial.

Today, and for four years, is under construction a car containing a stemming engine of one of my other special patents which will use small ingots of hydrogen - metal. More pollution, the only waste being some water, more auditive pollution.

The hydrogen - metal will also be the best fuels for the space, stable shuttles in the metal state and thus without risk of explosion as current fuels. Of more the volume being very small, the payload will allow more remote flights, without any risk of lack of fuel.

For the energy which the Earth needs at present the hydrogen - metal is an unlimited source(spring) of supply without pollution. The enormous advantage is also political: more wars to dominate the sources of supply, more false ideologies to dress the wars style Gulf Wars, a radical change of the current geopolitics.

Our current, overpopulated Earth, wasting its current reserves of Energy, is also subdued in the racket of the governments which impose taxes on the energy, what did not squeeze any more the case with the World Monopoly which I am setting up, because a true monopoly conceives only if the selling price is widely lower than all the cost prices of the current energies. The selling price will be ten centimes of euro by barrel fuel oil equivalent

I personally underwent a lot of attempt of theft of my work and my special patents, deposited for their real safety except European Community: France tried to steal me it and despoiled me of my laboratory. Several persons have my file, a Councillor to the Court of Appeal of Belgium, the President of ICENES on 2007. The President Sarkozy knows about it, in detail, and makes nothing to make me what was stolen from me. In spite of his electoral commitments. It is the reason for which France will be approved as customer only when it will be adjusted. Certain countries which will not be approved will have to continue to use the current energies and will so pay heavy taxes according to the Protocol of Tokyo. These countries will become the new Third World countries while those who will be approved will become rich countries.

The stake has arrangement of energy unlimited also impute a duty of protection of our planet, and does not have to be of use to the enrichment of only certain countries. Today the scientists have a Duty to the Humanity, and do not have to be any more allowed despoil by those who behave as hooligans.

My Special Patent of Cold Fusion is being developed for the benefit of mankind given the global energy crisis. I shall explain how our special patent of Cold Fusion can Produce continuously nor any pollution of the energy, and how the pure water can be used. For all the needs of the humanity. And outside any control of states, which in the past, surcharged excessively the essential sources of energy for the humanity.

My process of the cold fusion(merger) has to serve for bringing an essential complement in the provision of the energy. Of a cost of modest installation, of the order of twenty thousand euro, every production unit allows the supply of electricity and pure in great quantities water. I intend this Process at first to the human beings who have no access easily to these vital sources, particularly when they live in states which surcharge them. I think first of all in the countries sources of which dry up, and for Europe and particularly France, to the small farmers who are surcharged by a state to prévaricateur. We arrive at a stage of the civilization where the collectivism kills the individual, and I want to look to the individuals who are surcharged the means to live without having to pay either water or electricity.

In some words:

They are two major discoveries for the energy survival of the Humanity.
